

Title	Guideline for Using Pipeline Pig Cleaning for the Internal Diameter of Ductile Iron Fittings
Issue Date	March 30th, 2020
Document #	2020-102

SIP Industries does not recommend the use of pipeline cleaning pigs, methods or products for cleaning the internal diameter of ductile iron fittings. Research/experience has shown that significant damage will be done to the internal diameter and/or lining of ductile iron fittings.

If the customer, engineer or installer, decides to use pipeline cleaning pigs and/or products then this decision will present substantial risk of damage to the internal diameter of the fitting, sealcoat and/or cement-mortar lining or any other special lining or internal coating. Therefore, all such risk and liability are dependent on and assumed by the customer, engineer, installer, applicator or end user. SIP Industries does not warrant or guarantee the result or assume any risk or liability associated with the use of pipeline cleaning pigs, methods or products.

The extremely aggressive nature of pipeline cleaning products, methods and applications, in and of and by themselves, will cause damage to the internal diameter of the ductile iron fitting, sealcoat and/or cement-mortar lining or any other special lining or internal coating.
